**RICS**  
The mark of  
property professionalism worldwide

## **Professional responsibility**

This report has been commissioned and the actions of the surveyor have been made in accordance with the Code of Professional Conduct for the Institute of Ecology and Environmental Management. ([www.ieem.org.uk](http://www.ieem.org.uk)) and the Royal Institution of Chartered Surveyors ([www.rics.org.uk](http://www.rics.org.uk))

## **Accuracy of report**

This report has been compiled based on the methodology as detailed and the professional experience of the surveyor. Whilst the report reflects the situation found as accurately as possible, all of the protected species this survey covers are wild and can move freely from site to site. Their presence or absence detailed in this report does not entirely preclude the possibility of a different past, current or future use of the site surveyed.

We would ask all clients acting upon the contents of this report to show due diligence when undertaking work on their site and/or in their interaction with protected species. If protected species are found during a work programme, and continuing the work programme could result in their disturbance, injury or death, either directly or indirectly an offence may be committed.

If in doubt, stop work and seek further professional advice.

## **Quality and Environmental Assurance**

This report has been printed on recycled paper as part of our commitment to achieving both the ISO 9001 Quality Assurance and ISO 14001 Environmental Assurance standards. Envirotech have been awarded the Gold standard by the Cumbria Business Environmental Network for its Environmental management systems.

**COMMENTS ON CURRENT STATUS AND ANY IMMEDIATE AND FUTURE ACTIONS NEEDED:**

THE MAIN SITE SUPPORTS AN UNREMARKABLE ASSEMBLAGE OF COMMONLY OCCURRING PLANT SPECIES AS WELL AS LIMITED SCOPE FOR PROTECTED SPECIES.

THE POTENTIAL FOR DISTURBANCE OF OTTERS AND WHITECLAWED CRAYFISH ALONG THE STREAM CORRIDOR IS CONSIDERED TO HAVE SOME SIGNIFICANCE IN THE LOCAL AREA BUT CAN BE COMPENSATED FOR IN ANY FUTURE DEVELOPMENT.

THERE ARE NO RECORDS OF GREAT CRESTED NEWT IN PROXIMITY TO THE SITE, THE NEAREST RECORDS BEING AT HIGH PARK 553 METERS FROM THE SITE BOUNDARY ON THE OPPOSITE SIDE OF THE WEST COAST MAIN LINE, HOUSING ESTATE AND B6254.

## REPORT CONTROL SHEET

General Report Information	
Date of site risk assessment	2 <sup>nd</sup> February 2012
Project lead signature	Andrew Gardner - Director
Date report issued	2 <sup>nd</sup> November 2012
Report approved by	Andrew Gardner - Director

## RESULTS SUMMARY AND ACTIONS REQUIRED

### Results

1. The main site supports habitat of limited value to wildlife.
2. The principal ecological constraint to development would be the potential for an impact on otters and white clawed crayfish along the stream corridor.

### Actions Required

These actions are to meet compliance with current legislation, planning policy and best practice as recognised by the various statutory authorities. They are intended to fulfil ecological planning formalities and facilitate the implementation of the project.

1. The landscaping plan should incorporate wildlife friendly species.
2. Light spill onto the nearby stream should be minimised to preserve the foraging potential of these areas for otters.
3. A buffer should be established along the stream corridor to enhance its functionality due to the existing banks, on both sides, being open to grazing cattle.
4. New tree lines should be planted along the edge and within the site to create habitat linkage over and around the site.
5. The hedgeline on the West side of the site should be retained.
6. A crayfish rescue will be required in order to reinstate the former stream channel to the East of the site to a more normal course.

## 1.0 Background

### 1.1 Extended Phase 1 Survey

1.1.1 The Extended Phase 1 survey was undertaken by Andrew Gardner BSc (Hons), MSc, MRICS, MIEEM, CEnv and Miss Kate Stratham BSc (Hons). The survey followed the Phase 1 habitat survey methodology (NCC, 1990) which is a standard technique for recording and mapping habitats. The survey involved walking the whole site, mapping and describing different habitats (for example: woodland, grassland, scrub).

### 1.2 Timing and Constraints

1.2.1 The Phase 1 survey was carried out on 27<sup>th</sup> March and 2<sup>nd</sup> April 2012, the weather was dry, bright and warm throughout, the survey timing was during spring. In this case the time of year did not pose any constraint. Similarly, the timing posed no problems for the baseline protected species assessment, and no constraints were encountered in respect of achieving the survey objectives.

## 2.0 Phase 1 Survey Results

### 2.1 Habitat Results

2.1.1 The site is known as land off Oxenholme Road, Kendal and comprises an open area of improved pasture bounded by species poor hedges and residential housing. Other habitats on and adjacent to the site comprise allotments, roads and hard standing. See figure 1 for the Phase 1 Habitat Plan and descriptive botanical and faunal target notes, hereafter referred to as BTN and FTN.

2.1.2 The habitats encountered on and adjacent to the site were (in no particular order):

- Improved Pasture
- Cultivated/disturbed land - arable
- Species poor hedges
- Broadleaved scattered trees
- Wall
- Running water

### 2.2 Improved Pasture

2.2.1 The majority of the development site comprises improved pasture (BTN1). This appears to have been heavily grazed by livestock in recent years. The sward is short and dominated by coarse grass species. Species typical of improved pasture, subject recent grazing, include Cocksfoot (*Dactylis glomerata*), Yorkshire Fog (*Holcus lanatus*) and Fescue Sp. (*Festuca Sp.*).

2.2.2 Non grass species include Meadow Buttercup (*Ranunculus acris*), Dandelion (*Taraxacum officinale*), Red clover (*Trifolium pratense*) Spear Thistle (*Cirsium vulgare*) and Broad-leaved dock (*Rumex obtusifolius*).

2.2.3 Small patches of Common nettle (*Urtica dioica*) and Lords and Ladies (*Arum maculatum*) also occur along the base of the hedgerows.

2.2.4 Rush (*Juncus* sp.) which had been trampled and grazed and Lesser Celandine (*Ranunculus ficaria*) grow along the bank of the stream. The bankside was inspected for indications of Otter (*Lutra lutra*). No spraints, tracks or runs were located (see FTN1).

### 2.3 Cultivated/disturbed land - arable

2.3.1 At the South East of the site there is an area which is utilised to cultivate fruit. This area appears to be underlain by the previously described grass species within the improved grassland area (BTN2).

### 2.4 Species poor hedges

2.4.1 The Western boundary of the site is demarcated by a species poor hedgerow. The hedgerow is comprised, almost exclusively of Hawthorn (*Crataegus monogyna*) of varying ages. The hedgerow is largely unmanaged, with only a few sections (adjoining residential properties) showing signs of active management - in this case hedgelaying. None of the hedges meet the Hedgerow Regulations (1997) criteria for protection (BTN3).

### 2.5 Scattered Deciduous Trees

2.5.1 Along the far Western hedgerow boundary there are several scattered broadleaved trees. All of the trees were identified as English Oak (*Quercus rober*). On the Western end of the stone boundary wall which separates the improved grassland from the cultivated arable land, there is a single Hawthorn (*Crataegus monogyna*). None of these trees have significant bat roosting potential (BTN4)

### 2.6 Wall

2.6.1 A small section of dry stone boundary wall demarcates the boundary between the improved grassland and cultivated arable areas between the site entrance and the stream. Other small remnants of a stone boundary wall can be found within the hedgerow on the far west of the site. These stone walls appear to have negligible value for wildlife on this particular site.

### 2.7 Running Water

2.7.1 A narrow, fast flowing stream runs through the site from South East to North West. It supports a good community of aquatic macrophytes, dominated by floating sweet grass (*Glyceria fluitans*). No White Clawed Crayfish (*Austropotamobius pallipes*) were found during site visits, but the habitat is suitable for this species and there are records of their occurrence in the local area (FTN2).

\*Habitats outside the site boundary are indicative only and have been mapped from within the site boundary or from publicly accessible land

## 3.0 SUPPORTING INFORMATION

### 3.1 Scope and objectives

This report was commissioned in respect of the proposed future development of fields off of Oxenholme Road, Kendal:

1. To carry out an ecological assessment of the site to identify any habitats, species or features of nature conservation significance.
2. To undertake more in-depth surveys to assess the extent of any ecological risk identified.
3. To provide a concise written report of the results, making any appropriate recommendations to ensure compliance with wildlife law and recognised best practice.

### 3.2 General site description and methods

The site comprises of an improved grassland field and a small field of cultivated arable land, with the site bisected by a narrow, fast flowing stream. The site is bounded by a road to the East, fields to the south and residential properties and hospital grounds to the North and West.

A plan and photographs are provided earlier in this report.

### 3.3 Methodology

A consultation with the site agents was made following which the general site layout and adjacent environs were appraised. A search of the ecological records held by Tullie House Museum, Carlisle was also made. A table showing the results of the search is presented in Appendix 1.

There are several records of protected or notable species within 2km of the site on the datasets searched but no records for the site itself. No additional records searches were considered necessary based on our initial appraisal of the habitats associated with the site. The 2km buffer is sufficient to capture likely use of the site based on habitat fragmentation and availability.

The level of survey effort used for each species was derived from our assessment of the likely presence and susceptibility of each species to disturbance from the proposed development as well as its local abundance and level of protection/importance.

#### 3.3.1 Bats

The survey was carried out in full accordance with the recommendations in NCC (1987), Mitchell-Jones (2004) and BCT (2007).

This comprised a close inspection of all trees and buildings adjacent to or on the site. Trees were assessed for the suitability of bat roosting according to the number of niches present such as deep cavities, flaky or deeply fissured bark, hollow stems and location in relation to potential foraging or commuting habitat. The orientation of the tree and level of shade or nearby obstruction to free flight were also considered as part of the evaluation process.

Buildings were assessed in relation to their ability to support roosting or foraging by bats.

The general habitat at the site was evaluated in terms of its suitability to bats for foraging or commuting.

A bat activity survey was not conducted as in accordance with BCT (2012) the site could be sufficiently well assessed from a daytime walkover survey to be reasonably confident in the absence of roosting bats and to make an assessment of possible impacts on foraging.

All species of bat in the UK are protected under both UK and EU legislation. They are protected from deliberate disturbance, injury or killing. Any place they use for shelter is protected from alteration, obstruction or destruction, whether bats are present at the time or not.

### 3.3.2 Badger

The survey method was a scaled down version of the standard badger survey methodology as described in Harris et al (1989). In practice this comprised a generalized search of the whole site where suitable habitat was found, to a distance of 30m from the site boundaries, where this was possible, for feeding signs, habitual runs and footprints, hairs, droppings and latrines, scratching posts and actual setts.

Badgers are protected from deliberate disturbance when in an active sett and intentional killing or injury. The badger is the only UK species to be specifically covered by its own legislation the 1992 Protection of Badgers Act.

### 3.3.3 Birds

All nesting birds, other than pest species covered by specific exemptions where they are causing damage to livestock or crops, are protected from disturbance when actively nesting or rearing dependant young. An assessment of the sites potential to support nesting birds would reveal the level of past use of the site and likely impact of the development on nesting/ foraging opportunities for birds. The trees, buildings and stream bank were all inspected as an incidental part of the other surveys which were undertaken.

### 3.3.4 Invertebrates

The survey for these species was based on assessing the habitat type and suitability of the site.

It is our opinion that the above methodology was sufficient to make a risk assessment of site works and determine the likely effect on these species. As such we consider the above methodology constitutes reasonable effort in this case.

### 3.3.5 Plants

The vegetation composition of the site was assessed with key plant and tree species being identified.

### 3.3.6 Water vole

A detailed inspection of all suitable water courses occurring within a distance of 15m of each site boundary, where this was possible, following the methodology described in Strachan (1998) was carried out.

There is a single record for Water Vole in the local area (approximately 800m from site) from 1998. However, the watercourse at this site would not provide suitable habitat due to the level of grazing. Sheep and cattle have full access to the waters edge and as such, vegetation is short.

### 3.3.7 Otters

A search for habitual use of the site by otters such as spraints, haul out points, feeding remains, holts, runs and slides was undertaken.

### 3.3.8 Great Crested Newt

There is no suitable aquatic habitat at or in proximity to the site (250m). There is extreme habitat fragmentation due to a housing estate between the nearest pond 255m to the West and the site boundary. The terrestrial habitat is also poor, and the nearest records for the species are at High Park 553 meters from the site boundary on the opposite side of the West Coast Main line a housing estate and the B6254. No additional assessment was considered necessary.

### 3.3.9 White Clawed Crayfish

The stream bisecting the site offers suitable habitat for White Clawed Crayfish (*Austropotamobius pallipes*). Crayfish were not identified during site visits and they were not specifically targeted for survey.

The site is being put forward for outline planning consent. As such the final site layout and timing of work is unknown. Whilst the layout is unlikely to change significantly, it is not considered appropriate to disturb the stream and crayfish within it at this stage of the planning application. A large number of crayfish were captured by the Environment Agency when an adjacent housing estate was constructed along a stream which intersects that which flows through the site in the recent past. The habitat at this site is also considered suitable and as such this species is considered likely to be present.

Sampling to assess population levels at this stage of the application would result in triplication of survey effort as an additional survey would be required at full planning stage when the timing of work will be known and a mandatory survey would be required again as part of the license submission. The duplication of survey effort would, in our opinion, result in unnecessary disturbance of the species.

Its presence on site is inferred by habitat type and mitigation will be required to account for this including a rescue and habitat improvement.

This species is protected by the Wildlife & Countryside Act 1981 and is listed on Annex II of the Habitats Directive 1992, whereby sites can be designated specifically for its protection.

## 3.4 Limitations

White clawed crayfish surveys were not undertaken but its presence can be inferred from the habitats present and records for the local area. Surveys for this species would in our opinion result in unnecessary disturbance of the species.

## **4.0 RESULTS**

### 4.1 Protected sites

There are no Local Wildlife Sites or County Wildlife Sites in close proximity to the site.

### 4.2 Bats

There are no buildings on the site which will be lost and or partially modified by the proposal. All of the buildings adjacent to the site are of modern. They are considered to offer some roosting potential. It is considered bat roosting sites are likely to occur within the housing estate to the North and West.

Bats are likely to forage along the hedgerows to the North and West of the site. The core development area is not however considered to offer significant bat roosting or foraging potential.

Trees on and within the site boundaries were all assessed in accordance with BCT (2012). All were found to be category 3 (negligible) roosting potential. No significant impacts on potential bat roosts are predicted by the proposal.

Based on habitat and daytime inspections, additional survey work is considered unlikely to provide additional information about the status of the site for bats. In accordance with BCT (2012) no additional survey work is therefore required.

Mitigation to provide and retain new tree lines down the edge of and through the site and to minimise light spill will be required to maintain and enhance the foraging potential of the site.

#### 4.3 Badger

A detailed inspection of all suitable habitat at the site and to a distance of at least 30m from the site boundaries, where this was possible, revealed no active badger setts. No habitual runs, hair or scratch posts were found on or near suitable features on the site.

A search for snuffle holes (badger feeding signs) was made across the entire site. No indication of badger feeding was found.

Whilst badgers are believed to occur within 2km of the site, it is reasonable to assume that they do not have an active sett within 30m of the site boundary.

The proposed development will not impact on any existing badger runs or setts.

#### 4.4 Birds

Few potential nest sites were located on the site, with the most likely site being the hedgerow to the north of the site, adjoining residential properties. A risk assessment of the site in respect of its future potential for and value to nesting birds could be adequately made.

The open grassland would also not offer optimal nesting sites for ground nesting birds. Trees around the edge of the site would provide hunting perches for raptors which would increase the risk of predation.

The impact on nesting birds is therefore considered likely to be minor. A check for nesting birds should be undertaken prior to the removal of any trees or hedges if this is in the period March-September inclusive. The potential for use of the gappy hedges is however considered to be negligible.

The creation of a densely planted corridor along the stream corridor and trees on the edge of the site may provide shelter for nesting birds and would enhance the potential for use of the site.

#### 4.5 Invertebrates

A survey for invertebrates including, but not limited to solitary and mining bees and wasps and certain butterflies was triggered as a result of this site lying in proximity to semi-natural vegetation. The method of survey for these species was to assess the habitat type affected by development and therefore its likely importance at the local level to any of these species.

Trees on the site boundaries contain comparatively little rotten wood in their canopies.

Improved grassland has some value to species such as common butterflies but this is not considered to be locally significant.

The significance of the site to invertebrates is likely to be limited in the local context although the habitat on site will support invertebrate species. Mitigation can be incorporated into the design and landscaping scheme with the careful selection of plant species and substrates for the garden areas.

#### 4.6 Plants

Details of the plant species found on site are included in the target notes. Only common plant species were located. The species found within the site are largely generalists or associated with agricultural improvement. **No invasive or Schedule 9 weed species were identified on the site.**

The landscaping scheme should utilise native or wildlife friendly species. Mature trees on the site boundaries should be retained where it is possible and safe to do so on reflection of increased public access to the site.

#### 4.7 Water voles

There were no indications of this species found along the stream with the habitat being largely unsuitable for the species.

#### 4.8 Otter

There were no indications of this species found along the stream but the habitat here is suitable for the species to forage and it may occur locally.

No habitat potentially used by the species for resting (holt and couch sites) will be detrimentally affected by the proposal. The stream bank is open and exposed, there are no sufficiently closed areas where holts of couch sites could occur.

The planting of willow along the stream bank/ corridor would provide additional structural diversity at ground level than already occurs on the open and exposed stream banks. Additional planting to form a buffer along the stream will also provide above ground holt/ couch sites.

#### 4.9 White Clawed Crayfish

The stream running through the site provides potentially suitable habitat for this species. Local records show presence of this species in the local area, with the River Kent designated a Special Area of Conservation (SAC) in light of their occurrence. It is noted that high densities of White Clawed Crayfish occur in the tributaries of the Kent and thus the species is likely to occur on site.

Improvements to the stream channel, including re-alignment, as requested by the EA and the exclusion of livestock should result in net positive gains for this species on the site. A crayfish rescue will be required for re-alignment of the stream to occur. The road bridge has been designed to span the stream without impacting upon channel morphology.

### **5.0 Significance of Survey Results**

Though no indications of use by otters and white clawed crayfish could be found, they are known to occur in the local area. Precautionary mitigation for these species is considered to be appropriate. Minimisation of impacts to the stream and improvement of the riparian corridor are appropriate.

Bats are likely to use the surrounding landscape for foraging. The focus of this activity will likely be correlated with the trees along the stream bank. These may be slightly affected as a result of artificial lighting.

No indications of current use of the site by badgers or wolverines could be found.

We consider the site has a low potential for use by nesting and foraging birds. Mitigation through a check for nesting birds prior to site clearance will adequately mitigate for bird species. The site is unsuitable for notable ground nesting birds.

We judge the ecological significance of the vegetation at the site to be low in respect of its vegetative composition and importance to invertebrates.

Overall, it is considered there are likely to be no significant ecological constraints to development of the site. More than adequate provision for the slight degradation in habitat can be made through the use of wildlife friendly plant species in the landscaping plan, a crayfish rescue and the creation of a riparian buffer zone.

## 7.0 Mitigation Proposals

Taking the survey results and impacts above into consideration and the implications for the proposed site works mitigation measures are summarized as standalone draft methods statements in Appendix 2.

## 8.0 Conclusion

Ecological surveys, site appraisals and impact assessments were carried out with respect to land off Oxenholme Road, Kendal.

Bats are known to occur in the local area and are likely to use the site boundaries for foraging. No indications of Otters or Wolverines were found. Use of the site by these species would also be confined to the stream.

Badgers are considered to be absent at the site. There is some, albeit a low potential for use of the site for nesting by birds.

The stream is considered to be suitable habitat for White Clawed Crayfish. Improvement of the riparian corridor and the cessation of stock trampling and access to the stream should result in positive benefits to the stream channel and this species.

It is believed that the protected species potentially utilising the site will not be negatively affected by the proposed site development following the mitigation scheme outlined herein.

Enhancement of the site through landscaping, tree planting a riparian buffer zone will result in significant ecological improvement of the site.

I certify this report has been compiled in accordance with the code of professional conduct for the Institute of Ecology and Environmental Management and The Royal Institute of Chartered Surveyors and reflects my objective opinion of the facts found in relation to the instruction received and information available based upon the methodology, assumptions and constraints detailed within this report.

**Method Statement for Works**

**at**

**Oxenholme Road, Kendal**

## 1. Bats

The following table details each part of the site and works required to protect bats during the construction phase.

AREA OF SITE	POTENTIAL FOR USE BY BATS	RISK TO BATS FROM PROPOSED WORK	RECOMMENDATIONS
Open ground	No suitable roost sites. Low potential for foraging over open ground	Low risk	If bats are seen stop work and seek further advice
Semi-mature trees over 10cm BDH	No highly suitable fissures or cracks for roosting. Low potential for use	Low risk	Re-inspect any trees prior to felling. Be observant for bats during any felling operations in this area. If bats are seen stop work and seek further advice

### Commuting and foraging routes

The trees lines and scrub on the site boundaries provide habitat of local value to bats for foraging and should be retained.

Light spill onto the trees along the stream should be minimised. Mitigation for other species outlined later in this report is also considered more than sufficient to mitigate for any slight degradation in habitat quality and enhance the sites ecological functionality for bats. Minimisation of lighting impacts can be undertaken by directing lighting on the rear of the buildings along the North and West side of the site downwards only and planting a screen along the stream bank.

A new pond will and tree planting along the stream will create new high quality foraging sites.

## 2. Nesting Birds

The construction does not require the removal of dense trees or hedges suitable for nesting birds. When the gappy hedge through the centre of the site is removed, it should ideally be removed outside of the bird breeding season (i.e. not between end-February and mid-August inclusive) wherever possible. As nesting birds are easy to detect, hedges to be cleared within this time period should be searched for nesting birds prior to clearance by a suitably qualified individual.

If a nest is found, the feature containing the nest and its immediate surroundings will be left undisturbed until nesting is complete and any young have fledged.

## 3. White Clawed Crayfish

White Clawed Crayfish are highly sensitive to pollution so control of pollution both during and after construction is important. Prevention of any materials entering the water course during the development is required. A methods statement for protection of the water course will be prepared and implemented prior to the commencement of work when the timing and phasing of development is known.

In order to minimise disturbance and pollution to the water course, it is proposed that machinery and materials are transported over the stream by means of a temporary bridge.

Following construction, the planting of trees and willow on the banks of the stream may serve to increase refuge sites for crayfish, thus improving the overall quality of the habitat.

A crayfish rescue will be required for the re-alignment of the stream as requested by the Environment Agency.

#### ***4. Landscaping***

The use of native plant species in the landscaping plan as well as mixed substrates will vastly enhance the structural diversity of the site which will in turn benefit invertebrates.

We would also recommend that the trees and shrubs and/or willow are planted along the riparian corridor.

New planting along and within the site boundary will also create new habitat linkage.

Crayfish rescue required for re-alignment of existing stream

Methods statement for protection of stream to be prepared and implemented prior to commencement of site works when the timing and phasing of development known

**ACCOMMODATION SCHEDULE**

Type A, 2 Bed, 59.4msq, 539.1sqft:	22No
Type B, 3 Bed, 72.1msq, 775.8sqft:	27No
Type C, 3 Bed, 86.0msq, 925.4sqft:	7No
Type D, 3 Bed, 96.6msq, 1039.4sqft:	11No
Type E, 4 Bed, 99.0msq, 1065.2sqft:	27No
Type F, 4 Bed, 113.0msq, 1215.9sqft:	22No
Type G, 4 Bed, 157.0msq, 1689.3sqft:	12No
Type H, 4 Bed, 168.8msq, 1814.1sqft:	14No
Type J, 4-5Bed, 182.8msq, 1967.0sqft:	4No
Type K, 1 Bed, 40.9msq, 440.1sqft:	2No
<b>TOTAL:</b>	<b>148No</b>

35% Affordable units

New ponds to enhance the functionality of the site for bats, linked to improved corridor for commuting/ foraging bats

Hedge to the West side of the site retained

Boundary planting improved the existing poorly defined boundaries

Riparian buffer strip along the watercourse to provide habitat linkage across the site
